Dear Ms. Dunn,

This letter is in support of the registration of low volatility dicamba products for use in crops where weeds can be difficult to control in production. I am writing to encourage approval as soon as possible of a new label for over the top application of dicamba for soybeans so growers can continue to use this affective tool in their crop production strategies now and into the future.

Seed decisions for Spring 2021 are currently happening and seed companies are working with growers to provide products that not only maximize productivity but provide them with effective tools to minimize weed and pest pressures as well. The uncertainty in effective herbicide solutions can put a major strain on the entire supply chain process and leave our customers with a less effective solution to battle ever evolving resistant weeds.

Through extensive training and education, we have experienced significant success with our customers safely using this product and system to produce their soybean crop. We again encourage support of renewing the over the top label and hope that decision can be taken soon.

Thank you for your consideration.

Sincerely,

Chad Byers

Corporate Product Manager
